

CodeAlpha Task 03: Investment Portfolio Creation

Hypothetical Portfolio Value: Rs. 1,00,000 | Portfolio Date: 08-Jun-2026 | Risk Profile: Moderate Growth

1. Portfolio Objective

The objective of this portfolio is to create a balanced sample investment plan worth Rs. 1,00,000 using three asset groups: stocks, ETFs, and cryptocurrencies. The portfolio is designed for a moderate-growth investor who wants long-term equity exposure, diversification through ETFs, and a limited digital-asset allocation without allowing crypto volatility to dominate the portfolio.

Total Portfolio	Stocks	ETFs	Crypto
Rs. 1,00,000	Rs. 55,000 / 55%	Rs. 30,000 / 30%	Rs. 15,000 / 15%

2. Portfolio Allocation

Investment	Type	Allocation	Amount	Risk
Reliance Industries	Stock	20%	Rs. 20,000	Moderate-High
HDFC Bank	Stock	18%	Rs. 18,000	Moderate
TCS	Stock	17%	Rs. 17,000	Moderate-High
SBI Nifty 50 ETF	ETF	20%	Rs. 20,000	Moderate
Gold BeES ETF	ETF	10%	Rs. 10,000	Low-Moderate
Bitcoin	Crypto	7%	Rs. 7,000	High
Ethereum	Crypto	5%	Rs. 5,000	High
Solana	Crypto	3%	Rs. 3,000	Very High

3. Investment Rationale

Stocks (55%) are used as the main growth engine. Reliance Industries adds diversified exposure through energy, retail, telecom, and new-energy themes. HDFC Bank adds financial-sector exposure through a large private bank. TCS adds IT-services exposure, but its allocation is controlled because the Indian IT sector has recently faced pressure from AI-disruption concerns and rate-sensitive global demand.

ETFs (30%) improve diversification. The SBI Nifty 50 ETF provides broad Indian market exposure and reduces single-company risk. Gold BeES adds a defensive hedge because gold can help reduce portfolio stress during equity-market volatility, currency pressure, and geopolitical uncertainty.

Cryptocurrencies (15%) are included only as a limited high-risk allocation. Bitcoin receives the largest crypto weight because it is the most established crypto asset. Ethereum is used for smart-contract ecosystem exposure. Solana is capped at 3% because it is more volatile and should not dominate the portfolio.

4. Risk Management Strategy

- Keep crypto exposure capped at 15% because BTC, ETH, and SOL can move sharply in either direction.
- Rebalance quarterly so that stocks, ETFs, and crypto remain close to their target weights.
- Use ETFs to reduce concentration risk from individual stocks.
- Avoid leverage or borrowed money because this is a student-level hypothetical portfolio, not a trading strategy.
- Review news, earnings, interest-rate conditions, currency movement, and regulatory developments before making real investment decisions.

5. Conclusion and Recommendation

This Rs. 1,00,000 model portfolio is suitable as a balanced internship project because it includes growth, diversification, and risk-control logic. The recommended allocation is 55% stocks, 30% ETFs, and 15% crypto. The strongest part of the portfolio is its diversified structure: Indian equities provide growth, ETFs provide market and defensive exposure, and crypto provides limited participation in digital assets. For a real investor, this should be treated only as an educational model and not as personal financial advice.
